

Complete five (5) of the following problems. Each problem is worth 16 points. CLEARLY mark the problems you do not want graded. You must show your work to receive credit for problems requiring math. Report your answers with the appropriate number of significant figures. You do not need to account for activities in your calculations.

1. Consider the titration curve below. The curve is the result of the titration of 20.00 mL of a 0.100 M solution of one of the acids below with 0.100 M NaOH. Identify the acid. Clearly justify your decision.

Acid	pK _a 's
Acetic	4.75
Phosphoric	2.17, 7.20, 12.15
Succinic	4.21, 5.64
HCl	strong
Maleic	1.91, 6.33
Pyruvic	2.55

- 2

4. Complete the following calculations: (8 points each)
- Determine the pH of a 5.04×10^{-8} F solution of sodium hydroxide.
 - A 0.020 F solution of succinic acid ($\text{pK}_{\text{a}1} = 4.20$, $\text{pK}_{\text{a}2} = 5.64$) is buffered at pH 5.00. What fraction of the succinic acid is present as the amphiprotic form at this pH?

5. A 50.0 mL sample of 0.100 F freakinacidic acid (H_2A , $\text{pK}_{\text{a}1} = 3.00$, $\text{pK}_{\text{a}2} = 7.00$) is titrated with 0.200 F NaOH. Calculate the pH at any **three** of the following volumes of NaOH added: 0.0 mL, 10.0 mL, 20.0 mL, 30.0 mL, 40.0 mL, 50.0 mL, 60.0 mL, 70.0 mL, 80.0 mL, 90.0 mL, 100.0 mL.
6. Briefly explain how we are able to use initial concentrations in the Henderson-Hasselbalch equation and still get reasonable estimates of the equilibrium pH of a solution? Under what conditions would this not be the case?

7. Your new employer has asked you to prepare 1.00 L of a pH 12.00 buffer with a total phosphate concentration of 0.0500 M. You have at your disposal the following compounds

Compound	K_a	Molar Mass (g/mol)
H_3PO_4	7.11×10^{-3}	97.9950
NaH_2PO_4	6.34×10^{-8}	119.9769
Na_2HPO_4	4.22×10^{-13}	141.9588
Na_3PO_4	--	163.9407

- a. Which two compounds would you use to prepare a buffer of pH 12.00 and how many grams of each of the two selected compounds would you need? (12 points)

- b. If you did exactly what you calculated in part (a), you would not get a pH of *exactly* 12.00. Why? Explain how you would really prepare this buffer in lab. (4 points)

Possibly Useful Information

$V_b \cdot 10^{-\text{pH}} = K_a (V_e - V_b)$	$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
$[H^+] = \sqrt{\frac{K_{a1}K_{a2}F + K_{a1}K_w}{K_{a1} + F}} \approx \sqrt{K_{a1}K_{a2}}$	$\text{pH} = \frac{1}{2}(\text{p}K_{a1} + \text{p}K_{a2})$
$\text{pH} = \text{p}K_a + \log \frac{[\text{conjugate base}]}{[\text{weak acid}]}$	$\alpha_{H_2A} = \frac{[H^+]^2}{[H^+]^2 + [H^+]K_{a1} + K_{a1}K_{a2}}$
$K_w = 1.0 \times 10^{-14} = [H^+][OH^-]$	$\text{pH} + \text{pOH} = 14.00$

Numbers in parenthesis are mass numbers of most stable or most common isotope.

Atomic weights corrected to conform to the 1963 values of the Commission on Atomic Weights.

The group designations used here are the former Chemical Abstract Service numbers.
