## Chemistry 222 Spring 2014 Exam 2: Chapters 6-7

Complete problem 1 and four of problems 2-6. CLEARLY mark the problem you do not want graded. You must show your work to receive credit for problems requiring math. Report your answers with the appropriate number of significant figures.

80 Points

## Bonus (4 points):

One day last week, Dr. Lamp told those in class a pH at 8:30 AM as he started class and said that the pH would be an answer to one of the exam 2 questions. What was that pH?\_\_3.68\_\_

## You MUST complete problem 1. (16 pts.)

 When ammonium sulfate dissolves, both the anion and the cation can participate in acidbase equilibria. Considering all the equilibria active in solution, write enough equations so that you could solve for the concentration of each species in a solution that is saturated with ammonium sulfate that also contains 0.10 M sodium nitrate. You must write the charge balance expression and <u>at least</u> one mass balance. *Identify all unknowns and write enough explicit, independent equations so that only algebra remains to solve for the unknowns. A numerical answer is not necessary. Do not consider activities.*

$(NH_4)_2SO_4(s)$	K <sub>sp</sub> = 276
NH4 <sup>+</sup>	K <sub>a</sub> = 5.7 x 10 <sup>-10</sup>
SO4 <sup>2-</sup>	K <sub>b</sub> = 9.8 x 10 <sup>-13</sup>

Reactions (Unknowns are in **Bold**):

 $(NH_4)_2SO_4(s) \neq 2NH_4^+ + SO_4^{2^-}$   $NH_4^+ \neq NH_3 + H^+$   $SO_4^{2^-} + H_2O \Rightarrow HSO_4^- + OH^ H_2O \Rightarrow H^+ + OH^ NaNO_3 \rightarrow Na^+ + NO_3^-$ 

So, we need a total of eight equations for our eight unknowns.

Charge Balance:

 $[NH_4^+] + [H^+] + [Na^+] = 2[SO_4^{2-}] + [HSO_4^-] + [OH^-] + [NO_3^-]$ 

Mass Balance:

total concentration of "ammonia" = 2(total concentration of sulfur (sulfate))  $[NH_3] + [NH_4^+] = 2[SO_4^{2-}] + 2[HSO_4^-]$ Concentrations of Na<sup>+</sup> and NO<sub>3</sub> are constant  $[Na^+] = 0.10 \text{ M}$  $[NO_3^-] = 0.10 \text{ M}$ 

Equilibrium constant expressions:

$$K_{a} = \underline{[NH_{3}][H^{+}]}_{[NH_{4}^{+}]} K_{sp} = [NH_{4}^{+}]^{2} [SO_{4}^{2-}] K_{w} = [H^{+}] [OH^{-}]$$

$$K_{b} = \underline{[HSO_{4}^{-}][OH^{-}]}_{[SO_{4}^{2-}]}$$

We now have enough equations to solve for all of the unknowns.

#### Do four of problems 2-6. Clearly mark the problem you do not want graded. (16 pts. ea.)

2. A saturated solution of BaSO<sub>4</sub> ( $K_{sp} = 1.1 \times 10^{-10}$ ) that originally held a volume of 1.00 L is allowed to evaporate until the solution volume is 0.500 L. How does the new concentration of Ba<sup>2+</sup> compare to the concentration in the original solution? Clearly justify your response, using calculations were appropriate. *Do not consider activities*.

Since the solution was initially saturated, a decrease in solution volume will force an increase in the concentrations of  $Ba^{2+}$  and  $SO_4^{2-}$  in solution, leading to supersaturation. This increase will cause the  $K_{sp}$  for barium sulfate to be exceeded, resulting in the precipitation of  $BaSO_4$ , and a decrease in the concentration of  $Ba^{2+}$  and  $SO_4^{2-}$  back to their original values. Therefore, the  $[Ba^{2+}]$  after evaporation will be the same as its initial concentration.

Is it possible to perform a 99.99 % complete separation of barium and silver by precipitation with sulfate if both Ba<sup>2+</sup> and Ag<sup>+</sup> are present initially at 0.020 M? Justify your decision. Do not consider activities.

BaSO<sub>4</sub> 
$$K_{sp} = 1.1 \times 10^{-10}$$
  
Ag<sub>2</sub>SO<sub>4</sub>  $K_{sp} = 1.4 \times 10^{-5}$ 

Two equilibria to consider:

 $\begin{array}{l} \text{BaSO}_4 = \text{Ca}^{2+} + \text{SO}_4^{2-} \\ \text{Ag}_2 \text{SO}_4 = 2\text{Ag}^+ + \text{SO}_4^{2-} \\ \end{array} \qquad \begin{array}{l} \text{K}_{\text{sp}} = 1.1 \text{ x } 10^{-10} \\ \text{K}_{\text{sp}} = 1.4 \text{ x } 10^{-5} \end{array}$ 

1. What  $[SO_4^{2-}]$  is needed to lower each ion's concentration to 0.01% of its initial value? Target  $[Ba^{2+}] = 0.0001(0.020M) = 2.0 \times 10^{-6} M$ , Target  $[Ag^+] = 2.0 \times 10^{-6} M$ 

Ba<sup>2+</sup>:  $[SO_4^{2-}] = \frac{K_{Sp}}{[Ba^{2+}]} = \frac{1.1 \times 10^{-10}}{2.0 \times 10^{-6} \text{ M}} = 5.5 \times 10^{-5} \text{ M SO}_4^{2-}$ 

Ag<sup>+</sup>:  $[SO_4^{2-}] = \frac{K_{sp}}{[Ag^+]^2} = \frac{1.4 \times 10^{-5}}{(2.0 \times 10^{-6} \text{ M})^2} = 3.5 \times 10^6 \text{ M } SO_4^{2-} \text{ (wow!)}$ 

So, Ba<sup>2+</sup> will precipitate first

2. Will Ag<sup>+</sup> precipitate if  $[SO_4^{2-}] = 5.5 \times 10^{-5} \text{ M}$ ? Q =  $[Ag^+]^2[SO_4^{2-}] = (0.020 \text{ M})^2(5.5 \times 10^{-5} \text{ M}) = 2.2 \times 10^{-8}$ 

Since  $Q < K_{sp}$  for  $Ag_2SO_4$ ,  $Ag^+$  will not precipitate before  $[Ba^{2+}] = 2.0 \times 10^{-6} M$ . Separation is feasible. 4. Consider the table of activity coefficients on the last page of this exam. As you move from left to right across any row on the table, the values for activity coefficient decrease. As you move down in a given column, the activity coefficient also decreases. Clearly describe the phenomena that cause these trends. Do not simply point out the trends; you must explain why the trends exist. No calculations are necessary.

The cause for both trends is rooted in electrostatic interactions between the ion of interest and other materials in solution. Moving left to right across a row in the table, the ionic strength of the solution increases. As  $\mu$  increases, there is a greater probability that the ion of interest will undergo an interaction with a third-party ion in solution, thus decreasing its activity in the reaction of interest. Moving down in the table, the charge on the ion is increasing. This increase in charge provides for stronger electrostatic interactions with all other ions in solution, also reducing activity.

 Using activities, find the silver concentration of a solution of 0.0167 M Mg(NO<sub>3</sub>)<sub>2</sub> saturated with Ag<sub>2</sub>CrO<sub>4</sub> (K<sub>sp</sub> for Ag<sub>2</sub>CrO<sub>4</sub> is 1.2 x 10<sup>-18</sup>). Compare this result to that obtained if you were to ignore activities.

Let's set up the system first:

	Ag <sub>2</sub> CrO <sub>4</sub>	=	2 Ag⁺	+	CrO <sub>4</sub> <sup>2-</sup>
i	-		0		0
С	-		+2x		+x
е	-		2x		X

$$\mathsf{Ksp} = (\mathsf{A}_{\mathsf{Ag}+})^2 \mathsf{A}_{\mathsf{CrO4-}} = (\gamma_{\mathsf{Ag}+}[\mathsf{Ag}^+])^2 \gamma_{\mathsf{CrO4}}[\mathsf{CrO_4}^-] = (\gamma_{\mathsf{Ag}+}[2x])^2 \gamma_{\mathsf{CrO4}}[x] = 4(\gamma_{\mathsf{Ag}+})^2 \gamma_{\mathsf{CrO4}}(x)^3$$

x =  $[CrO_4^{2^-}] = \left[\frac{K_{sp}}{4(\gamma_{Ag^+})^2\gamma_{CrO4}}\right]^{1/3}$ [Ag<sup>+</sup>] = 2x

To find activity coefficients, we need to calculate ionic strength:  $[Mg^{2^+}] = 0.0167 \text{ M}$   $[NO_3] = 2(0.0167 \text{ M}) = 0.0334 \text{ M}$   $\mu = 1/2([Mg^{2^+}] (+2)^2 + [NO_3^-](-1)^2) = 1/2(0.0167(4) + 0.0334(1)) = 0.050 \text{ M}$ For  $\mu = 0.050 \text{ M}$ ,  $\gamma_{Ag^+} = 0.80$ ,  $\gamma_{CrO42^-} = 0.445$ 

$$[Ag^{+}] = 2x = 2 \left[ \frac{K_{sp}}{4(\gamma_{Ag+})^2 \gamma_{CrO4}} \right]^{1/3}$$

Substituting into the equation above gives  $[Ag^{+}] = 2.03 \times 10^{-6} M$ 

Ignoring activities,

$$[Ag^{+}] = 2x = 2 \left[ \underbrace{K_{sp}}_{4} \right]^{1/3}$$

Which gives  $[Ag^+] = 1.34 \times 10^{-6} M$ 

6. Ethylamine  $(CH_3CH_2NH_2)$  is a monobasic weak base with a pK<sub>b</sub> of 3.33. Calculate the pH of a solution prepared by mixing 20.0 mL of 0.010 M HCl with 50.0 mL of 0.046 M ethylamine  $(CH_3CH_2NH_2)$  and diluting the resulting solution to 100.0 mL. *Do not consider activities*.

What's left after HO	CI and ethylam	nine react?							
	+ E	3	$\rightarrow$	BH⁺	+	Cl⁻			
Start (mmol)	2.3			0 mmol	0 mmol				
End (mmol)	2.3-0.2	2 = 2.1		0.20 0.20					
Concentration(M)	0	2.1mmol/	/100mL =		0.20mmol/100 mL =	C	0.0020 M		
		0.02	21 M		0.0020M				
Now the equilibrium B I 0.021M C -x E 0.021-x	n: + H₂O <i>⇒</i>   	BH <sup>+</sup> 0.0020M +x 0.0020+x	+ OH <sup>-</sup> 0 +x x		$K_{b} = (0.002)$	3]	(X)		

After some algebra,  $0 = x^2 + (0.0020 + K_b)x - 0.021K_b$ Solving for x, we get x = [OH<sup>-</sup>] = **0.00213<sub>4</sub>M**, [H<sup>+</sup>] = K<sub>w</sub>/[OH<sup>-</sup>] = 4.68<sub>5</sub>x10<sup>-12</sup> M **pH = 11.33**.

# **Possibly Useful Information**

$K_a K_b = K_W = 1.0 \times 10^{-14}$	Don't eat the yellow snow.
$-\log\gamma = \frac{0.51z^2\sqrt{\mu}}{1+\alpha\sqrt{\mu}/305}$	$\mu = \frac{1}{2}\sum_{i}c_{i}z_{i}^{2}$
$\Delta G = \Delta H - T \Delta S = -RTInK$	$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
$H_2O \Rightarrow H^+ + OH^ K_w = 1.00 \times 10^{-14}$	pH = -log[H⁺]
