

Complete problem 1 and four of problems 2-6. CLEARLY mark the problem you do not want graded. You must show your work to receive credit for problems requiring math. Report your answers with the appropriate number of significant figures.

Bonus (4 points):

One day last week, Dr. Lamp told those in class a pH at 8:30 AM as he started class and said that the pH would be an answer to one of the exam 2 questions. What was that pH? _____

You MUST complete problem 1. (16 pts.)

1. When ammonium sulfate dissolves, both the anion and the cation can participate in acid-base equilibria. Considering all the equilibria active in solution, write enough equations so that you could solve for the concentration of each species in a solution that is saturated with ammonium sulfate that also contains 0.10 M sodium nitrate. You must write the charge balance expression and at least one mass balance. *Identify all unknowns and write enough explicit, independent equations so that only algebra remains to solve for the unknowns. A numerical answer is not necessary. Do not consider activities.*

Do four of problems 2-6. Clearly mark the problem you do not want graded. (16 pts. ea.)

2. A saturated solution of BaSO_4 ($K_{\text{sp}} = 1.1 \times 10^{-10}$) that originally held a volume of 1.00 L is allowed to evaporate until the solution volume is 0.500 L. How does the new concentration of Ba^{2+} compare to the concentration in the original solution? Clearly justify your response, using calculations where appropriate. *Do not consider activities.*

3. Is it possible to perform a 99.99 % complete separation of barium and silver by precipitation with sulfate if both Ba^{2+} and Ag^+ are present initially at 0.020 M? Justify your decision. *Do not consider activities.*

4. Consider the table of activity coefficients on the last page of this exam. As you move from left to right across any row on the table, the values for activity coefficient decrease. As you move down in a given column, the activity coefficient also decreases. Clearly describe the phenomena that cause these trends. Do not simply point out the trends; you must explain why the trends exist. No calculations are necessary.

5. *Using activities*, find the silver concentration of a solution of 0.0167 M $\text{Mg}(\text{NO}_3)_2$ saturated with Ag_2CrO_4 (K_{sp} for Ag_2CrO_4 is 1.2×10^{-18}). Compare this result to that obtained if you were to ignore activities.

6. Ethylamine ($\text{CH}_3\text{CH}_2\text{NH}_2$) is a monobasic weak base with a pK_b of 3.33. Calculate the pH of a solution prepared by mixing 20.0 mL of 0.010 M HCl with 50.0 mL of 0.046 M ethylamine ($\text{CH}_3\text{CH}_2\text{NH}_2$) and diluting the resulting solution to 100.0 mL. *Do not consider activities.*

Possibly Useful Information

$K_a K_b = K_w = 1.0 \times 10^{-14}$	Don't eat the yellow snow.
$-\log \gamma = \frac{0.51 z^2 \sqrt{\mu}}{1 + \alpha \sqrt{\mu} / 305}$	$\mu = \frac{1}{2} \sum_i c_i z_i^2$
$\Delta G = \Delta H - T \Delta S = -RT \ln K$	$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$
$H_2O \rightleftharpoons H^+ + OH^- \quad K_w = 1.00 \times 10^{-14}$	$pH = -\log[H^+]$
