

Complete each of the following problems.

1. Consider the two molecules below. For each molecule, draw bond dipoles for each bond and determine whether the molecule is polar. You may justify your answer in no more than two sentences. (6 pts.)

Compound		
Polar?	Yes No	Yes No
Brief justification	Even though each of the C-F bonds is polar, the tetrahedral geometry causes all of the bond dipoles to cancel, making the molecule itself nonpolar.	The C-H bonds are essentially nonpolar, but the C=O bond is polar. This, combined with the trigonal planar structure leads to a polar molecule.

2. Place a check mark by the all of the types of intermolecular interactions that each of these molecules can undergo. (4 pts.)

			
<input checked="" type="checkbox"/> hydrogen bonding	<input type="checkbox"/> hydrogen bonding	<input type="checkbox"/> hydrogen bonding	<input checked="" type="checkbox"/> hydrogen bonding
<input checked="" type="checkbox"/> dipole-dipole	<input type="checkbox"/> dipole-dipole	<input checked="" type="checkbox"/> dipole-dipole	<input checked="" type="checkbox"/> dipole-dipole
<input checked="" type="checkbox"/> dispersion forces	<input checked="" type="checkbox"/> dispersion forces	<input checked="" type="checkbox"/> dispersion forces	<input checked="" type="checkbox"/> dispersion forces

To save some calculation time, you may round all atomic masses to two (2) decimal points.
