Avogadro's number: $\mathrm{N}_{\mathrm{A}}=6.022 \times 10^{23} \mathrm{~mol}^{-1}$

Metric Prefixes

| Prefix | Symbol | Multiplier |
| :---: | :---: | :---: |
| pico | p | $10^{-12}$ |
| nano | n | $10^{-9}$ |
| micro | $\mu$ | $10^{-6}$ |
| milli | m | $10^{-3}$ |
| centi | c | $10^{-2}$ |
| kilo | k | $10^{3}$ |
| mega | M | $10^{6}$ |

Common Polyatomic Ions

| Name | Symbol |
| :---: | :---: |
| ammonium | $\mathrm{NH}_{4}^{+}$ |
| hydroxide | $\mathrm{OH}^{-}$ |
| nitrate | $\mathrm{NO}_{3}{ }^{-}$ |
| bicarbonate | $\mathrm{HCO}_{3}{ }^{-}$ |
| sulfate | $\mathrm{SO}_{4}{ }^{2-}$ |
| carbonate | $\mathrm{CO}_{3}{ }^{2-}$ |
| phosphate | $\mathrm{PO}_{4}{ }^{3-}$ |

## JBA 2022 - Chemistry Exam 1

Name: $\qquad$ Score: $\qquad$ $/ 100=$ $\qquad$ /80

1. Which of the following is a member of the group of elements called the halogens? (2 points)
a. potassium
b. calcium
c. bromine

Answer $\qquad$ c $\qquad$
d. argon
2. When beryllium forms an ion, what charge will the ion have? (2 points)
a. +1
b. -1
c. +2

Answer $\qquad$ c $\qquad$
d. -2
3. The electron configuration for manganese is: ( 2 points)
a. $\quad 1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6} 4 s^{2}$
b. $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6} 3 d^{5} 4 s^{2}$
c. $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2} 3 p^{6} 3 d^{7}$

Answer $\qquad$ b $\qquad$
d. $1 s^{2} 2 s^{2} 2 p^{6} 3 s^{2}$
4. Which item below IS NOT part of Dalton's atomic theory? (2 points)
a. All atoms of a particular element are identical
b. Atoms combine in whole number ratios to form compounds.

Answer $\qquad$ c $\qquad$
c. Atoms can be split into protons, neutrons and electrons
d. Reactions involve the rearrangement of atoms.
5. Below are four statements about protons, only one of which is true. Identify the true statement. (2 points)
a. Protons have about the same mass as electrons.
b. Protons have about the same mass as neutrons.
c. Some atoms don't have any protons.

Answer $\qquad$ b $\qquad$
d. Protons have the same magnitude of charge as neutrons, but opposite sign
6. Which of these bonds to you expect to be the most polar? (2 points)
a. F-F
b. O-F
c. N-F

Answer $\qquad$ d $\qquad$
d. C-F
7. Which of the following elements occurs naturally as a diatomic molecule? (2 points)
a. sulfur
b. helium
c. carbon

Answer $\qquad$ d__
d. oxygen
8. Match the term with its definition. (8 points)

| __B_ electron | A. a dumb bell shape in space where an electron or a pair of electrons can be found |
| :---: | :---: |
| __I__mass number | B. a subatomic particle with a mass of 1/1824 and a charge of -1 |
| __F__electronegativity | C. negatively charged species that forms when an atom gains one or more electrons |
| __E__compound | D. a generalization that in most stable molecules, many atoms will share in eight outer electrons to fill their valence shell. |
| __H__covalent bond | E. a pure substance made up of two or more elements in a fixed characteristic chemical combination and composition |
| D__octet rule | F. the tendency for an atom to attract electrons toward itself in a bond. |
| __C_anion | G. atoms of the same element, but with different number of neutrons |
| G__ isotopes | H. a chemical bond created when two atoms share electrons. |
|  | I. the number of protons and neutrons that atom contains. |
|  | J. positively charged species that forms when an atom loses one or more electrons |

9. Complete the table for the elements below: (8 points)

| Element | Electron Configuration | Number of Valence <br> Electrons |
| :---: | :---: | :---: |
| Silicon | $1 \mathrm{~s}^{2} 2 \mathrm{~s}^{2} 2 \mathrm{p}^{6} 3 \mathrm{~s}^{2} 3 \mathrm{p}^{2}$ | 4 |
| Chlorine | $1 \mathrm{~s}^{2} 2 \mathrm{~s}^{2} 2 \mathrm{p}^{6} 3 \mathrm{~s}^{2} 3 \mathrm{p}^{5}$ | 7 |

10. Complete the following table. (10 points)

| Symbol | ${ }_{6}^{12} \mathrm{C}$ | ${ }_{26}^{55} \mathrm{Fe}$ | ${ }_{20}^{40} \mathrm{Ca}^{2+}$ |
| :--- | :---: | :---: | :---: |
| \# of protons | 6 | 26 | 20 |
| \# of neutrons | 6 | 29 | 20 |
| \# of electrons | 6 | 26 | 18 |
| Charge | 0 | 0 | +2 |
| Mass \# | 12 | 55 | 40 |
| Atomic \# | 6 | 26 | 20 |

11. Complete the table below: (8 points)

| Formula | Name |
| :---: | :---: |
| ZnS | zinc (II) sulfide |
| $\mathrm{N}_{2} \mathrm{O}_{5}$ | dinitrogen pentoxide |
| $\mathrm{PF}_{6}$ | phosphorous hexafluoride |
| $\mathrm{Na}_{2} \mathrm{O}$ | sodium oxide |

12. Fill-in the proper term for each item indicated on the diagram below. The terms are group/family, electronic configuration, atomic number, atomic mass, atomic symbol, atomic name. (6 points)

13. Complete the following table. (6 points)

| g Cu | $=$ | 8.14 mol Cu | $=$ |
| :---: | :---: | :---: | :---: |

In order to relate moles and mass, we need to use the molar mass, so we must molar mass of copper from the periodic table, where we find copper has a molar mass of 63.546 grams per mole.

Now the conversion between moles and grams:

$$
8.14 \mathrm{molCt} \mathrm{x} \frac{63.564 \mathrm{~g}}{1 \mathrm{molCu}}=517.41 \mathrm{~g}=517 \mathrm{~g} \mathrm{Cu}
$$

To convert between moles and molecules, we use Avogadro's number that tells us that $1 \mathrm{~mol}=6.022 \times 10^{23}$ molecules.

$$
8.14 \mathrm{~mol} \mathrm{Cu} \times \frac{6.022 \times 10^{23} \text { atoms }}{1 \mathrm{~mol} \mathrm{Cu}}=4.9019 \times 10^{24} \text { atoms }=4.90 \times 10^{24} \text { atoms } \mathbf{C u}
$$

14. Use your understanding of molecular structure and intermolecular forces to explain why methane $\left(\mathrm{CH}_{4}\right)$ is a gas at room temperature and water $\left(\mathrm{H}_{2} \mathrm{O}\right)$ is a liquid. The structures for methane and water are shown below. (6 points)

You should talk about the fact that methane is a nonpolar molecule, but water is polar, due to the electronegativity differences of atoms in the bonds and the orientation of the bonds in the molecule. As a result, water can undergo stronger intermolecular forces (like dipole-dipole interactions), that methane cannot. These stronger intermolecular forces require more energy to disrupt, making it more difficult to cause water to go from the liquid phase to the gas phase (that is, to boil).
15. Draw Lewis structures for the following compounds and determine their shape and polarity. (12 pts)

| Species | Draw the Lewis Structure | Molecular Shape <br> Circle the correct shape. <br> (You may build a model) | Polar Molecule? <br> Circle yes or no. |
| :---: | :---: | :---: | :---: |
| $\mathrm{NH}_{3}$ |  | Linear <br> Bent <br> Trigonal Planar <br> Trigonal Pyramidal <br> Tetrahedral | $\begin{aligned} & \text { Yes } \\ & \text { No } \end{aligned}$ |
| $\mathrm{CH}_{2} \mathrm{O}$ |  | Linear <br> Bent <br> Trigonal Planar <br> Trigonal Pyramidal <br> Tetrahedral | Yes <br> No |
| $\mathrm{CS}_{2}$ | $\ddot{\mathrm{S}}=\mathrm{C}=\ddot{\mathrm{S}}$ | Linear <br> Bent <br> Trigonal Planar <br> Trigonal Pyramidal <br> Tetrahedral | Yes <br> No |

16. Balance the following reactions: (12 points)
a. $\quad$ _2__ $\mathrm{C}_{2} \mathrm{H}_{6}+\ldots 7 \ldots \mathrm{O}_{2} \rightarrow \ldots 4 \_\mathrm{CO}_{2}+\ldots 6 \_\mathrm{H}_{2} \mathrm{O}$
b. $\qquad$ $\mathrm{PCl}_{5}+\ldots 4 \_\mathrm{H}_{2} \mathrm{O} \rightarrow$ $\qquad$ $\mathrm{H}_{3} \mathrm{PO}_{4}+$ $\qquad$ 5 HCl
$\qquad$ Sn $\qquad$
$\qquad$ $\mathrm{NaOH} \rightarrow$ $\qquad$ $\mathrm{Na}_{2} \mathrm{SnO}_{2}+$ $\qquad$ $\mathrm{H}_{2}$
17. Describe what an individual helium atom $\left({ }_{2}^{4} \mathrm{He}\right)$ looks like. Be as detailed as you can. You may wish to include a sketch. (5 points)

Helium atoms are comprised of a nucleus that contains two protons and two neutrons and comprises most of the mass of the atom. The remainder of the atom consists of electrons in orbitals around the nucleus. The orbitals contain electrons and mostly empty space. A sketch might look something like this:

18. Aluminum metal must be prepared by extracting it from minerals found in ore. One natural mineral that contains aluminum is gibbsite, which is $34.59 \%$ aluminum by mass. How many grams of aluminum could you produce from 2.76 grams of pure gibbsite? (5 Points)
$34.59 \%$ means 34.59 grams aluminum per 100 grams gibbsite, 0.954684 :
2.76 g gibbsite $\times \frac{34.59 \mathrm{~g} \text { aluminum }}{100-\mathrm{g} \text { gibbsite }}=0.954684 \mathrm{~g}$ aluminum $=\mathbf{0 . 9 5 5} \mathrm{g}$ aluminum
